PROFILE

Junior full-stack developer focused on the backend: REST APIs in Node.js, Express and TypeScript on MongoDB, with React front-ends. I work with layered architecture, automated testing and continuous integration, and my main projects are deployed and publicly reachable so they can be checked. I use AI tools to move faster, but I review, test and understand every line I ship — the engineering judgement is mine. Looking for my first formal role on a team where I can contribute from day one and grow through real code review. English at B2 level, comfortable working asynchronously with distributed teams.

PROJECTS

Personal projects with public source code and live applications. Every figure below is reproducible by running the repository.

TaskFlow API — task and project management REST API

TypeScript, Express, MongoDB, Jest, Docker · github.com/Tojohtml98/taskflow-api

- **Automated testing:** 46 integration tests across 4 suites running against an in-memory MongoDB instance; the full suite passes green in roughly 10 seconds, with 97% statement and 98.7% line coverage.
- **Layered architecture:** each module (auth, projects, tasks) is split into routes, controller, service, repository and model, keeping business logic independent of Express and Mongoose.
- **Authentication and security:** JWT with refresh-token rotation, bcrypt password hashing, request validation with Zod, security headers via Helmet and rate limiting on the login and registration endpoints.
- **CI and deployment:** a GitHub Actions pipeline runs type checking, tests and build on every push and pull request; multi-stage Docker image, deployed on Render and currently live.

Turnero API — appointment booking with automated reminders

TypeScript, Express, MongoDB, node-cron, Nodemailer

- **167 passing tests** across 9 suites, covering availability calculation, business hours, authentication and a natural-language date parser.
- Slot engine that derives availability from business hours and existing bookings, plus scheduled cron jobs that send appointment reminders by email.

Code Reviewer Agent — AI-assisted code review CLI

Node.js, Claude Agent SDK · github.com/Tojohtml98/code-reviewer-agent

- Command-line tool built on Anthropic's agent SDK: it takes a git diff and reports findings on bugs, security and clarity. A concrete example of bringing AI into the workflow while keeping the final decision on the human side.

Front-ends and deployed applications

React, Vite, Firebase

- TaskFlow React client consuming my own API (taskflow-client-nu.vercel.app), a personal portfolio in React + Vite and an e-commerce built with React and Firebase. Four applications currently live across Render and Vercel.

TECHNICAL SKILLS

Backend: Node.js, Express, TypeScript, JavaScript, MongoDB, Mongoose, REST APIs, JWT and refresh tokens, bcrypt, Zod, Helmet, rate limiting, structured logging with Pino.

Testing and quality: Jest, Supertest, integration testing, mongodb-memory-server, code coverage, layered architecture, strict type checking.

Frontend: React, Vite, HTML and CSS, REST API consumption, Firebase.

Infrastructure and tooling: Docker and multi-stage builds, docker-compose, GitHub Actions, Git and GitHub, deployment on Render and Vercel, Linux.

Applied AI: Claude Agent SDK, integrating assistants into the development workflow with human review and validation of everything generated.

Languages: Spanish (native) · English B2 (professional working proficiency, written and spoken).

EDUCATION

Coderhouse — Full-Stack Development Program — Completed

English — B2 upper-intermediate — Professional working proficiency

Continuous learning — testing, software architecture and backend best practices, applied to the projects above — Ongoing
